No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq

E BIOCHEM: Pharmacol. 49:1323-1329(1995).

L BIOCHEM: Pharmacol. 49:1323-1329(1995).

C -!- FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTH COP GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULA OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.

C -!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NADH.

C -!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.

C -!- SUBUNIT: HOMOTETRAMER.

C -!- SUBUNIT: HOMOTETRAMER.

C -!- SUBUNIT: HOMOTETRAMER.

C -!- SIBULARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO GMP REDUCTASE.

J. Biol. Chem. 263:15769-15772(1988).
-i- PUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SY
OF GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REC
OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT
MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.
-i- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)0 -
xanthosine 5'-phosphate + NADH.
-i- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 between the Swiss Institute of Bioinformat

Biophys. Acta 1217:156-162(1994).

FUNCTION: IMP IS THE RATE LIMITING ENZYME IN THE DE NOVO SYNTH OF GUANINE NUCLEOTIDES AND THEREFORE IS INVOLVED IN THE REGULA OF CELL GROWTH. IT MAY ALSO HAVE A ROLE IN THE DEVELOPMENT OF MALIGNANCY AND THE GROWTH PROGRESSION OF SOME TUMORS.

CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2)0 = xanthosine 5'-phosphate + NADH.

PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.

SUBUNIT: HOMOTETRAMER.

SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC IMPDH AND TO
                                                                                                                                                                                                                                                                                                                     SIMILARITY: CONTAINS 2 CBS DOMAINS.

Bacteriol. 179:2331-2338(1997).
-!- FUNCTION: ESSENTIAL ENZYME IN THE DE NOVO BIOSYNTHESIS CATALYSING THE NAD-DEPENDENT OXIDATION OF IMP TO XMP.
-!- CATALYTIC ACTIVITY: Inosine 5'-phosphate + NAD(+) + H(2 xanthosine 5'-phosphate + NADH.
-!- PATHWAY: FIRST REACTION UNIQUE TO GMP BIOSYNTHESIS.
-!- DEVELOPMENTAL STAGE: EXPRESSED AT EQUAL LEVELS IN THE Y
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRAIN=SS;

Tagami H., Takahashi H.,
                                       BEEN SHOWN TO VAKY MILLIANDE STEE AND SUBUNIT COMPOSITIONS.

SIZE AND SUBUNIT COMPOSITIONS.

MISCELLANGUS: IMP DEHYDROGENASE SUBUNIT OF E.COLI CONTAINS CYSTEINE AT THE IMP BINDING SITE & IS INHIBITED IN A SIMPLE COMPETITIVE MANNER BY GMP. IT DOES NOT EXHIBIT ALLOSTERIC PROPERTIES AS DOES IMP DEHYDROGENASE FROM BACILLUS SUBTILIS PROPERTIES PRO
                                                                                                                                                                                                                                                                                                                             CARALYTIC ACTIVITY: Inosine 5'-phosphat xanthosine 5'-phosphate + NADH. PATHWAY: FIRST REACTION UNIQUE TO GMP ESUBUNIT: HOMOTETRAMER.
MISCELLANEOUS: IMP DEHYDROGENASE FROM CHEEN SHOWN TO VARY WIDELY WITH RESPECT
